Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation, psoriasis.

Claim 12; Page 62; 88pp; English

The invention relates to an antiinflammatory compound (especially AAM48628-AAM48645), comprising a membrane translocation domain (AAM48620-AMM48627 or AAM48646-AAM48651) which comprises from 6-15 amino acid residues, fused to a NEMO binding sequence (AAM48525-AAM48619). The

antinflammatory compounds have antiasthmatic, cytostatic, antipsoriatic, antirheumatory compounds have antiasthmatic, antibacterial, antirheumatic, antiarthritic, osteopathic, antibacterial, amunosuppressive, dermatological, neuroprotective, nootropic, antiatherosclerotic, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NFkappaB activation by blocking interaction of IkappaB kinase beta (IKKbeta) at the NEWO binding compain that results in inhibition of IKKbeta kinase activation and subsequent decreased phosphorylation of IkappaB. The compounds are useful for treating inflammatory disorders, e.g. asthma, lung inflammation or cancer, psoriasis, rheumatoid arthritis, osteopararthritis, inflammatory bowel disease, sepsis, vasculitis, bursitis; autoimmune diseases such as lupus, polymyalgia, scleroderma, granulomatosis, multiple sclerosis; transplant rejection; osteoporosis; Alzheimer's diseases such as viral infections; and ataxia telangiectasia. The compounds are also urticaria, anaphylaxis, drug or food sensitivity, eczema, dermatitis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation, psorlasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            0;

residues, tuber to a new Distance (Approved to antipsoriatio, antiplammatory compounds have antiasthmatic, cytostatic, antipsoriatic, antisfammatory compounds have antiasthmatic, cytostatic, antipsoriatic, antiarthmistic, osteopathic, antibacterial, contropic antiartherosclerotic, virucide and antiallergic activity. The compounds antiatherosclerotic, virucide and antiallergic activity. The compounds cart as selective inhibitors of cytokine-mediated NFKappaB activation by contropic in that reaults in inhibition of IKKappaB. The compounds are useful subsequent decreased phosphorylation of IKKappaB. The compounds are useful contropic in inhibition of IKKappaB. The compounds are useful subsequent decreased phosphorylation of IKKappaB. The compounds are useful for treating inflammatory disorders, e.g. asthma, lung inflammation or corner, psoriamis, rheumatoid arthritis, osteoarthritis, inflammatory concer, psoriamis, rheumatoid arthritis, attanimumum diseases such as clerosis; transplant rejection; osteoporosis; Alzheimer's disease; atherosclerosis; viral infections; and ataxia telangiectasia. The compounds are also curticaria, anaphylaxis, drug or food sensitivity, eczema, dermatitis, viral cumburn, aging and arthritis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0
               AAM48628-AAM48645), comprising a membrane transiocation domain (AAM48620-AAM48627 or AAM48646-AAM48651) which comprises from 6-15 amino acid residues, fused to a NEMO binding sequence (AAM48525-AAM48619). The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             inflammatory bowel disease; sepsis; vasculitis; autoimmune disease; systemic lupus erythematosus; multiple sclerosis; cancer; osteoporosis; systemic lupus erythematosus; multiple sclerosis; cancer; osteoporosis; Alzheimer's disease; viral infection; NP-kappa B essential modulator;

The invention describes an anti-inflammatory compound comprising (1). The compound is useful for diagnosing or treating inflammatory disorders, such as asthma, psoriasis, rheumatoid arthritis, osteoarthritis, inflammatory bowel disease, sepsis, vasculitis, autoimmune diseases (e.g. systemic lupus erythematosus), multiple sclerosis, cancer, osteoporosis, Alzheimer's disease or viral infection. This is the amino acid sequence an anti-iflammatory peptide that binds to, and down-regulates, necrosis factor kappa B (NFkB) essential modulator (NBMO).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    NEMO binding domain; NBD; I kappa B kinase beta; IKKbeta; antiinflammatory; antiasthmatic; antipsoriatic; antirheumatic; antiarthritic; osteopathic; antibacterial; immunosuppressive; dermatological; neuroprotective; cytostatic; nootropic; virucide; gene therapy; anti-inflammatory; inflammatory disorder; asthma; psoriaais; rheumatoid arthritis; osteoarthritis; autimanatory bowel disease; sepsis; vasculitis; autoimmune disease; systemic lupus erythematosus, multiple sclerosis; cancer; osteoporosis; Alzheimer's disease; viral infection; NF-kappa B essential modulator;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New compound for diagnosing or treating inflammatory disorders, e.g. asthma, psoriasis, rheumatoid arthritis, inflammatory bowel disease or cancer, comprises a membrane translocation domain and a NEMO binding
            New compound for diagnosing or treating inflammatory disorders, e.g. asthma, psoriasis, rheumatoid arthritis, inflammatory bowel disease cancer, comprises a membrane translocation domain and a NEMO binding
                                                                                                                                                                                                                                                                                                                                    100.0%; Score 105; DB 6; Length 18; 100.0%; Pred. The invention describes an anti-inflammatory compound comprising (I). The compound is useful for diagnosing or treating inflammatory disorders, such as asthma, psoriasis, rheumatorid arthritis, osteoarthritis, inflammatory bowel disease, sepsis, vasculitis, autoimmune diseases (e.g. systemic lupus erythematosus), multiple sclerosis, cancer, osteoporosis, Allaheimer's disease or viral infection. This is the amino acid sequence of an anti-iflammatory peptide that binds to, and down-regulates, necrosis factor kappa B (NPkB) essential modulator (NEMO).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention describes an anti-inflammatory compound comprising (I). The compound is useful for diagnosing or treating inflammatory disorders,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   inflammatory bowel disease; sepsis; vasculitis; autoimmune disease; systemic lupus erythematosus; multiple sclerosis; cancer; osteoporosis; Alzheimer's disease; viral infection; NF-kappa B essential modulator;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     or

The invention relates to modulating NF-kappaB (NF-kB) induction in a cell comprises contacting a cell with an anti-inflammatory compound (ABB08725-ABB08742) comprising at least one NEWO binding domain (ABB77313). The compound has acts through selective inhibition of cytokine-mediated NF-kB activation by blocking the interaction of NEWO with IKKbeta at the NEWO binding domain. Blockage of IKKbeta-NEWO interaction results in inhibition of IKKbeta kinase activation and subsequent decreased phosphorylation of IkappaB. The compound may also act (directly or indirectly) by blocking the recruitment of leukocytes into sites of acute and chronic inflammation, by down-regulating the expression of E-selectin
                 inflammatory bowel disease, sepsis, vasculitis, autoimmune diseases (e.g. systemic lupus erythematosus), multiple sclerosis, cancer, osteoporosis, Alzheimer's disease or viral infection. This is the amino acid sequence of an anti-iflammatory peptide that binds to, and down-regulates,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Modulating NF-kappaB induction in a cell, useful for treating e.g. inflammatory disorders, osteoporosis and cancer, comprises contacting a cell with an anti-inflammatory compound comprising at least one NEMO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            IXKDeat; IXKalpha; NEMO; NEMO binding domain; NBD; NF-kappaB; NF-kB; kinase activation; leukocyte; inflammation; E-selectin; osteoclast; autoimmune disease; transplant rejection; osteoprososis; cancer; Alzheimer's disease; viral; infection; asthma; anaphylaxis; psoriasis; rheumatoid arthritis; Crohn's disease; miltiple sclerosis; HIV; corticosteroid; immunosuppression; antiinflammatory; immunosuppressive; osteopathic; cytostatic; nootropic; neuroprotective; anti-HIV; human; antiarteriosclerotic; virucide; antiasthmatic; antiallergic; dermatological; antibacterial; antipsoriatic; antirheumatic; antiallergic; antiarthritic; osteopathic; antiulcer.

cc useful in treating NP-kB mediated conditions, where the condition is an inflammatory disorder, an autoimmune disease, transplant rejection, csteoporosis, cancer, Alzheimer's disease, atherosclerosis, a viral infection or ataxia telangiectasia. The inflammatory disorder is asthma, allergies, urticaria, anaphylaxis, cutaneous inflammation, sepsis, conflammatory bowel disease, chronic obstructive pulmonary disease, onflammatory bowel disease, chronic obstructive pulmonary disease, cardendatis, escenaribitis, osteoarthritis, psoriatic arthritis, and bursitis. The inflammatory disorder may also be conflammatory bowel disease, chronic obstructive pulmonary disease, and spondylarthritis. Also for Crohn's disease, ulcerative colitis, caused by Epstein-barr, otherway a granulomatosis, temporal arteritis, crused by Epstein-barr, otherway or herpes simplex. Other viral diseases include HIV and influenza. The compound may also be useful for treating anaphylaxis, drug and food sensitivity, contact dermatitis, cuburn or aging. The compound may be used to replace corticosteroids in any application in which corticosteroids are used, including immunosuppression in transplants and cancer therapy. Also for identifying antiniflammatory agents. The present sequence is that of the NEMO antiniflammatory agents. The present sequence is that of the NEMO contains demander or contains demander or contains and contains that of the NEMO contains demander or contains demander or contains and contains and contains and contains that of the NEMO contains demander or contains demander or contains and contains and contains and contains that of the NEMO contains demander or contains demander or contains demander of antiniflammatory agents. The invention relates to an antiinflammatory compound (especially AAM48628-AAM48645), comprissing a membrane translocation domain (AAM48620-AAM48628) and comprises from 6-15 amino acid residues, fused to a NEMO binding sequence (AAM4852-AAM48619). The residues, fused to a NEMO binding sequence (AAM4852-AAM48619). The antiinflammatory compounds have antiasthmatic, cytostatic, antipsoriatic, antiathratic, osteopathic, antibacterial, immunosuppressive, dermatological, neuroprotective, nootropic, antiatherosclerotic, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NFkappaB activation by contain that results in inhibition of IKKbeta kinase activation are useful compaint that results in inhibition of IKKbeta kinase activation are useful contraction of IkappaB kinase beta (IKKbeta) at the NEMO binding contains inflammatory disorders, e.g. asthma, lung inflammatory concert, psoriasis, rheumaticid arthritis, osteoarthritis, inflammatory concert, polymyalgia, scleroderma, granulomatosis, multipple sclerosis, transplant rejection; osteoporosis, Alzheimer's disease, atherosclerosis, cuseful for treating pro-inflammatory responses such as allergies, curicaria, anaphylaxis, drug or food sensitivity, eczema, dermatitis, such authritis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ÷0
Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation, psoriasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

The present invention relates to antiinflammatory compounds comprising NEWO binding domain (NBD) peptides. The NEWO binding domains are found on Ikappas kinase-alpha (IKKalpha)

Proteins The antiinflammatory compounds of the invention are useful for modulating nuclear factor-kappas (NF-kappas) induction in a cell, where the compounds are capable of blocking the interaction between one or more IKKs such as IKKalpha or IKKDeta, and NEWO. The antiinflammatory compound further comprises at least one membrane translocation domain. The compounds are useful for treating inflammatory disorders, autoimmune compounds are useful for treating inflammatory disorders, autoimmune compounds are useful for treating inflammatory disorders, autoimmune viral infections, Ataxia telangiectasia, and for transplantation detection. The compounds of the invention block NF-kappas induction by IKK but do not inhibit the basal activity of NF-kappas. The present sequence represents an antiinflammatory compound of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ·;
                                                  Novel antiinflammatory peptide compounds comprising NEWO binding domain, useful for modulating NF-kappaB induction in a cell and for treating NF-kappaB-mediated inflammation disorders e.g., asthma, psoriasis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            antinflammatory; antiasthmatic; antipsoriatic; antirheumatic; antiarthmitic; actionatic; antibacterial; antirheumatic; dereopathic; antibacterial; immunosuppressive; dermatological; neuroprotective; cytostatic; nootropic; virucide; gene therapy; anti-inflammatory; inflammatory disorder; asthma; psoriasis; rheumatoid arthritis; osteoarthritis; inflammatory bowel disease; sepsis; vasculitis; autoimmune disease; systemic lupus erythematosus; multiple sclerosis; cancer; osteoporosis; systemic lupus erythematosus; multiple sclerosis; cancer; osteoporosis; necrosis factor kappa B essential modulator;

                                                                                                                                                                                                                                     The invention describes an anti-inflammatory compound comprising (1). The compound is useful for diagnosing or treating inflammatory disorders, such as asthma, portials, rheumatorid arthritis, osteoarthritis, inflammatory bowel disease, sepsis, vasculitis, autoimmune diseases (e.g. systemic lupus erythematosus), multiple sclerosis, cancer, osteoporosis, Alabeimer's disease or viral infection. This is the amino acid sequence of an I kappa B kinase beta (IKKbeta) NEMO binding domain (NBD) used in to determine which residues in the NBD are important for binding NEMO (necrosis factor kappa B essential modulator).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Inflammatory bowel disease; sepsis; vasculitis; autoimmune disease; systemic lupus erythematosus; multiple sclerosis; cancer; osteoporosis; Alzheimer's disease; viral infection; NF-kappa B essential modulator; necrosis factor kappa B essential modulator.
                                                                                     New compound for diagnosing or treating inflammatory disorders, e.g. asthma, psoriasis, rheumatoid arthritis, inflammatory bowel disease or cancer, comprises a membrane translocation domain and a NEMO binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           NEMO binding domain, NBD; I kappa B kinase beta; IKKbeta; antiinflammatory; antiasthmatic; antipsoriatic; antirheumatic; antiarthritte; osteopathic; antibacterial; immunosuppressive; dermatological; neuroprotective; cytostatic; nootropic; virucide; gene therapy; anti-inflammatory; inflammatory disorder; asthma; psoriasis; rheumatoid arthritis; osteoarthritis;

                                                                                                                                                                                                                                                                  The invention describes an anti-inflammatory compound comprising {
m (I)} . The
                                                                                                                                                                                                                                                                                                      compound is useful for diagnosing or treating inflammatory disorders, such as asthma, psoriasis, rheumatoid arthritis, osteoarthritiss, inflammatory bowl disease, sepsis, vasculitis, autoimmune disease, espsis, vasculitis, autoimmune disease, espsis, systemic lupus erythematosus), multiple sclerosis, cancer, osteoporosis, Alzheimer's disease or viral infection. This is the amino acid sequence of an I kappa B Kinase beta (IKKDeta) NEMO binding domain (NBD) used in to determine which residues in the NBD are important for binding NEMO (necrosis factor kappa B essential modulator).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     corticosteroid; immunosuppression; antiinflammatory; immunosuppressive; corticosteroid; immunosuppression; osteopathic; cytostatic; nootropic; neuroprotective; anti-HIV; human; antiatreitosclerotic; virucide; antisathmatic; antiallergic; dermatological; antibacterial; antipsoriatic; antirheumatic; antiathritic; osteopathic; antiulcer; mutant; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  kinase activation; leukocyte; inflammation; E-selectin; osteoclast; autoimmune disease; transplant rejection; osteoporosis; cancer; Alzheimer's disease; viral; infection; asthma; anaphylaxis; psoriasis; rheumatoid arthritis; Crohn's disease; multiple sclerosis; HIV;
                                       or
New compound for diagnosing or treating inflammatory disorders, e.g. asthma, psoriasis, rheumatoid arthritis, inflammatory bowel disease cancer, comprises a membrane translocation domain and a NEMO binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      IKKbeat; IKKalpha; NEMO; NEMO binding domain; NBD; NF-kappaB; NF-kB;

Modulating NF-kappaB induction in a cell, useful for treating e.g. inflammatory disorders, osteoporosis and cancer, comprises contacting cell with an anti-inflammatory compound comprising at least one NEWO
                                                                                                                                                                                                                                 Claim 23; Fig 5; 82pp; English.
                                                                                                                                        binding domain.
```

inhibition of IKKDeta kinase activation and subsequent decreased
phosphorylation of IkappaB. The compound may also act (directly or
indirectly) by blocking the recruitment of leukocytes into sites of acute
and chronic inflammation, by down-regulating the expression of B-selectin
can chronic inflammation, by down-regulating the expression of B-selectin
on leukocytes or by blocking osteoclast differentiation. The compound is
caseful in treating NF-KB mediated conditions, where the condition is an
inflammatory disorder, an autoimmune disease, transplant rejection,
osteoporosis, cancer, Alzheimer's disease, atherosclerosis, a viral
infection or ataxia telangiecrasia. The inflammatory disorder is asthma,
allergies, urticaria, anaphylaxis, cutaneous inflammation, sepsis,
psoriasis, rheumatoid arthritis, cutaneous inflammatory bowel disease, chronic obstructive pulmonary disease,
canceriatis, eczema, psoriasis, osteoarthritis, psoriatic arthritis,
and spondylarthritis. Also for Crohn's disease, ulcerative colitis, The invention relates to modulating NF-kappaB (NF-kB) induction in a cell comprises contacting a cell with an anti-inflammatory compound (ABB08725-ABB08742) comprising at least one NEWO blinding domain (ABB77313). The compound has acts through selective inhibition of cytokine-mediated NF-kB activation by blocking the interaction of NEWO with IKKbeta at the NEWO blinding domain. Blockage of IKKbeta-NEWO interaction results in immunosuppression in transplants and cancer therapy. Also for identifying antiinflammatory compounds and for diagnosis of an inflammatory disorder. The compound may be administered alone or in combination with other known anti-inflammatory agents. The present sequence is that of a mutated NEMO binding domain of IKKDeta polymyalgia, scleroderma, Wegner's granulomatosis, temporal arteritis, cryoglobulinaemia or multiple sclerosis. For chronic viral infections caused by Epstein-barr, cytomegalovirus or herpes simplex. Other viral diseases include HIV and influenza. The compound may also be useful for treating anaphylaxis, drug and food sensitivity, contact dermatitis, subburn or aging. The compound may be used to replace corticosteroids in any application in which corticosteroids are used, including in

AAM48524 standard; peptide; 28 AA. AAM48524; RESULT 12 AAM48524

(first entry) 20-MAR-2002

NBD peptide SEQ ID NO 19.

Antiinflammatory; antiasthmatic; cytostatic; antipsoriatic; nootropic; antirheumatic; antiarthmitic; osteopathic; antibacterial; virucide; immunosuppressive; dermatological; neuroprotective; antiatherosclerotic; antiallergic; membrane translocation domain; NEMO binding domain; ezzema; cytokine; MrkappaB; IkappaB kinase beta; IKKbeta; cancer; psoriasis; rheumatorid arthritis; osteoarthritis; inflammatory bowel disease; autoimmune disorder; multiple solerosis; transplant rejection; osteoprosis; Alzheimer's disease; atherosclerosis; viral infection; ataxia telangiectasia; allergy; anaphylaxis; arthritis.

IkappaB kinase-beta; IkappaB kinase-alpha; IKKalpha; NF-kappaB; nuclear factor-kappaB induction; inflammatory disorder; autoimmune disease; osteoporosis; cancer; Alzheimer's disease, atherosclerosis; viral infection; Ataxia telangiectasia; transplantation detection; immunosuppressive; osteopathic; cytostatic; nootropic; neuroprotective; antiatherosclerotic; virucide; vasotropic;

Human; antiinflammatory compound; NEMO binding domain; NBD; IKKbeta;

MARKA MARKA BY TAKA

Human mutant NEMO binding site (NBD) peptide.

12-JUN-2003 (first entry)

ABU08435;

Synthetic

```
The invention relates to an antiinflammatory compound (especially AAM48628-AAM48645), comprising a membrane translocation domain (AAM48620-AAM48645), comprising a membrane translocation domain (AAM48620-AAM48645), compounds to a NEMO binding sequence (ABM48525-AAM48619). The antiinflammatory compounds have antiasthmatic, antiarthitic, antiarthitic, osteopathic, antibacterial, immunosuppressive, dermatological, neuroprotective, nootropic, antiatherosclerotic, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NFkappaB activation by blocking interaction of IkappaB kinase beta (IKKbeta) at the NBMO binding domain that results in inhibition of IKKbeta kinase activation and subsequent decreased phosphorylation of IkappaB. The compounds are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  for treating inflammatory disorders, e.g. asthma, lung inflammation or cancer, psoriasis, rheumatoid arthritis, osteoarthritis, inflammatory bowel disease, sepsis, vascullitis, bursitis; autoimmune diseases such as lupus, polymyalgia, scleroderma, granulomatosis, multiple sclerosis, transplant rejection; osteoporosis; Alzheimer's disease; atherosclerosis; viral infections and ataxia telangiectasia. The compounds are also useful for treating pro-inflammatory responses such as allergies, urticaria, anaphylaxis, drug or food sensitivity, eczema, dermatitis,
                                                                                                                                                                                                                                                                                                                                                    Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation, psoriasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score 77; DB 5; Length 28;

The NEMO binding domains are found on IrkappaB kinase-beta (IrKabeta) and IkappaB kinase-alpha (IrKapta) proteins. The antiinflammatory compounds of the invention are useful for modulating nuclear factor-kappaB (NF-kappaB) induction in a cell, where the compounds are capable of blocking the interaction between one or more IKKs such as IrKapha or IrKbeta, and NEMO. The antiinflammatory compound further comprises at least one membrane translocation domain. The compounds are useful for treating inflammatory disorders, autoimmune diseases, osteoporosis, cancer, Alzheimer's disease, atherosclerosis, viral infections. Ataxia telangiectasia, and for transplantation detection. The compounds of the invention block NF-kappaB induction by IKK but do not inhibit the basal activity of NF-kappaB. The present
                                                                                                                                                                                                                                                                           Novel antiinflammatory peptide compounds comprising NEMO binding domain, useful for modulating NF-kappaB induction in a cell and for treating NF-kappaB-mediated inflammation disorders e.g., asthma, psoriasis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                NEMO binding domain; NBD; I kappa B kinase beta; IKKbeta;

The invention describes an anti-inflammatory compound comprising (I). The compound is useful for diagnosing or treating inflammatory disorders, such as asthma, poriasis, rheumatorid arthritis, osteoarthritis, inflammatory bowel disease, sepsis, vasculitis, autoimmune diseases (e.g. systemic lupus erythematosus), multiple sclerosis, cancer, osteoporosis, Alzheimer's disease or viral infection. This is the amino acid sequence of a I kappa B kinase beta (IKKbeta) NEWO binding domain (NBD) mutant used in to determine which residues in the NBD are important for binding NEMO (necrosis factor kappa B essential modulator).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    NEMO binding domain, NBD; I kappa B kinase beta; IKKbeta; antinflammatory; antiasthmatic; antipsoriatic; antirheumatic; antiarterial; antinosuppressive; dertaptitic; osteopathic; antibacterial; immunosuppressive; dermatological; neuroprotective; cytostatic; nootropic; virucide; gene therapy; anti-inflammatory; inflammatory disorder; asthma; psoriasis; rheumatoid arthritis; osteoarthritis; autoimmune disease; systemic lupus erythematosus; multiple sclerosis; cancer; osteoporosis; systemic lupus erythematosus; multiple sclerosis; cancer; osteoporosis; hlzheimer's disease; viral infection; NF-kappa B essential modulator; necrosis factor kappa B essential modulator;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    6650,
                                                                                                                                                                                                                                                                                                                                                                                                                                    Description

Mol. 22:3549-3561(2002)
-!- FUNCTION: Phosphorylates inhibitors of NF-kappa-B thus leading to the dissociation of the inhibitor/NF-kappa-B complex and ultimately the degradation of the inhibitor. Also phosphorylates NCOA3 (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  also as a homodimer. Directly interacts with IKK-gamma/NEMD.
Heterodimers form the active complex. The tripartite complex can also bind to MEKKI, MAPXIA/NIK, IKAP and IKB-alpha-p65-p50 complex. Phosphorylated IKB-alpha is further released from the complex. Found in a complex composed of NCOA2, NCOA3, IKKA, IKEKG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SUBCELLULAR LOCATION: Cytoplasmic.
ILSOE SPECIFICITY: Highly expressed in heart, placenta, skeletal muscle, kidhey, pancreas, spleen, thymus, prostate, testis and peripheral blood.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SUBUNIT: Preferentially found as a heterodimer with IKK-alpha but
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MEDLINE=20178139; PubMed=10712233;

PUCMAI.

SUBUNIT: Preferentially found as a heterodimer with IKK-alpha but also as a homodimer. Directly interacts with IKK-gamma/NEMO.

Heterodimers form the active complex. The tripartite complex can also bind to MEKKI, MAPSKI4/NIK, IKAP and IKB-alpha-p65-p50 complex. Phosphorylated IKB-alpha is further released from the complex. Found in a complex composed of NCOA2, NCOA3, IKKA, IKBKG and CREBBE (By similarity).

-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- TISSUE SPECIFICITY: Expressed in liver, kidney and spleen.
-!- DBVELOPMENTAL STAGE: While it is expressed ubguitoualy throughout the mouse embryo, at E9.5 day its expression begins to be localized to the brain, neural ganglia, neural tube, and in liver at E12.5 day. At E15.5 day, the expression is further restricted to specific tissues of the embryo.
-!- PTM: Phosphorylated by MEKKI and probably also by MAP3KI4/NIK.
Weakly autophosphorylated.
-!- SIMILARITY: BELDGSS THE SER/THR FAMILY OF PROTEIN KINASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This SWISS-PROT entry is copyright. Nemoto S., Dibonato J.A., Lin A.; "Coordinate regulation of IkappaB kinases by mitogen-activated protein "Coordinate regulation of IkappaB kinases by mitogen-activated protein kinase kinase kinase 1 and MP-kappaB-inducing kinase."; Mol. Cell. Biol. 18:7336-7343(1998).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SUBBUNIT: Preferentially found as a heterodimer with IKK-alpha but also as a homodimer. Directly interacts with IKK-gamma/NEWO.

Also as a homodimer. Directly interacts with IKK-gamma/NEWO.

Also bind to MEKKI, MAPSKI4/NIK, IKAP and IKB-alpha-p65-p50

complex. Phosphorylated IKB-alpha is further released from the

complex. Found in a complex composed of NCOA2, NCOA3, IKKA, IKBKG

and CREBBP (By similarity).

PTM: Phosphorylated by MEKKI and probably also by MAPSKI4/NIK.

PEM: Phosphorylated by MEKKI and probably also by MAPSKI4/NIK.

SIMILARITY: BELONGS TO THE SER/THR FAMILY OF PROTEIN KINASES.

IKAPPAB KINASE SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   J. Physiol. 278:C451-C462(2000). FUNCTION: Phosphorylates inhibitors of NF-kappa-B thus leading to the dissociation of the inhibitor/NF-kappa-B complex and ultimately the degradation of the inhibitor. Also phosphorylates
                                                                                                                                                                                                                                                                                                                                                                                                                       16-OCT-2001 (Rel. 40, Last sequence update)

"Expression of thick Barx-1 and its differential regulation by FGF-8

"Expression of thick Barx-1 and its differential regulation by FGF-8

"I and BMP signaling in the maxillary primordia.";

"I PUNCINON: Transcription factor, which may be involved in cranicfacial development, in odontogenesis and in stomach organogenesis. May have a regulatory module of the NCAM promoter.

"C organogenesis. Binds to a regulatory module of the NCAM promoter."

"C i- SUBCELLULAR LOCATION: Nuclear (Probable).

"C i- TISSUE SPECIFICITY: Expressed predominantly in the facial primordia at primordia, developing stomach, and proximal limbs.

"C i- DEVELOPMENTAL STAGE: First detectable in the facial primordia at stage 18 after neural crest migration. Expressed in regions derived from both mid-and hindbrain mearal organia in regions in the facial primordia at the facial primordia at the facial primordia at the facial primordia at stage 18 after neural crest migration. Expressed in regions derived from both mid-and hindbrain mearal organia in regions

May have a role in the differentiation of molars craniogenesis. May have a role in the differentiation of molars from incisors. Binds to a regulatory module of the NCAM promoter.

--- SUBCELLUIAR LOCATION: Nuclear (Probable).

--- SUBCELLUIAR LOCATION: Nuclear (Probable).

--- IISOUB SPECIFICITY: Widely expressed. Expressed at higher levels in testis and heart. Detected in craniofacial tissue and adult ints, but not in lymphocytes, fibroblasts, choroid retina, retinal pigment epithelium, kidney, or fetal liver.

--- POLYMORPHISM: The polymorphism is not associated with Axenfeld-Reiger syndrome (ARS), iridogoniodysgenesis syndrome (IGDS) or related ocular mallocimations.

--- SIMILARITY: Belongs to the BAR homeobox family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This SWISS-PROT entry is copyright. Mech. Dev. 51:3-151959.

I Mech. Dev. 51:3-151959.

C -!- FUNCTION: Transcription factor, which may be involved in craniofacial development, in odontogenesis and in stomach organogenesis. May have a role in the differentiation of molars from incisors. Binds to a regulatory module of the NCAM promoter.

C -!- SUBCELDUAR LOCATION: Nuclear (Probable).

C -!- SUBCELLUAR LOCATION: Nuclear (Probable).

all areas except the developing molars are BARX1-negative. I addition, BARX1 marks the area of the future stomach in the primitive gut at embryonic day 9.5, and is present in the mesenchymal wall of the stomach until embryonic day 16.5. SIMILARITY: Belongs to the BAR homeobox family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            012704, 036WV3; 03PP714;

-!- SUBCELLULLAR LOCATION: Mitochondrial.
-!- MISCELLANBOUS: In eukaryotes there are five DNA polymerases:
alpha, beta, gamma, delta, and epsilon which are responsible for different reactions of DNA synthesis.
-!- SIMILARITY: Belongs to the DNA polymerase type-A family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DB 1; Length 1018;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SMART; SM00482; POLAC; 1.

-:- FUNCTION: NDH-1 shuttles electrons from NADH, via FMN and ironsulfur (Fe-S) centers, to quinones in the respiratory chain. Couples the redox reaction to proton translocation (for every two electrons transferred, four hydrogen ions are translocated across the cytoplasmic membrane), and thus conserves the redox energy in a proton gradient (By similarity).
-:- CATALYIIC ACTIVITY: NADH + quinone = NAD(+) + quinol.
-:- SUBCELDUAR LOCATION: Integral membrane protein.
-:- SIMILARITY: Belongs to the complex I subunit 3 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          NUCA RICCN STANDARD; PRT; 123 AA.
